Summary

A highly motivated Computer Science graduate from Hanoi University of Industry with a strong passion for Artificial Intelligence. Experienced in developing and evaluating machine learning models, optimizing inference pipelines, and building practical AI applications in computer vision and retrieval-augmented generation. Committed to continuous learning and contributing to reliable, real-world AI solutions.

Education

09/2022 – 07/2026 **Bachelor of Computer Science**, *Hanoi University of Industry*, Hanoi
GPA: 3.2/4.0; coursework in Machine Learning, Data Science, Data Structures and Algorithms.

Completed **AI in Action — AI Application Track**, *VinUni*, Hanoi

Work Experience

07/2026 – 08/2026 **Model Optimization Intern**, *VinRobotics*, Hanoi

- Developed and evaluated vision-language-action policies for ALOHA, LIBERO, and UR10e robot manipulation, covering data conversion, fine-tuning, and open-/closed-loop evaluation.
- Ported Octo and TurboVLA inference from PyTorch to GGUF-backed C++/GGML/CUDA; matched all 2,968/2,968 TurboVLA semantic records in tensor-level parity checks.
- Fine-tuned Octo for ALOHA and LIBERO; achieved 8/10 successful jittered ALOHA rollouts and benchmarked native inference at 33.95 ms mean compute latency.
- Trained VLA-JEPA for UR10e joint action/world-model learning, reaching 0.003733 MAE and 99.186% gripper accuracy on 4,914 holdout frames.

Projects

06/2026 – 07/2026 **UEBA Endpoint Monitoring — AI in Action Build (Primary Developer)**
https://github.com/AI20K-Build-Cohort-2/C2-App-047

- Led core development of a user and entity behavior analytics platform that ingests endpoint activity, detects anomalies, and presents evidence-backed risk alerts for security analysts.
- Built the FastAPI/PostgreSQL backend, JWT/RBAC, idempotent log-ingestion APIs, and endpoint agents collecting logon, HTTP, device, file, email, process, and network events.
- Integrated GCN-LSTM with attention and FAISS inference into rolling user scoring; persisted anomaly scores and deduplicated real-time alert incidents.
- Developed Mistral-powered alert explanations and multi-turn AI chat grounded in alert data, with analyst feedback and long-term memory; containerized services with Docker.

06/2026 – 10/2026 **Deka — AI-Powered Exam Generation Platform (Independent Project)**
https://github.com/kamusarj/Deka

- Built a teacher-facing system that produces an exam matrix, specification, questions, answers, and grading rubric for Vietnamese middle-school science, with per-question review, regeneration, and DOCX/PDF export.
- Grounded generation in curated curriculum data, uploaded documents, and a question bank using hybrid BM25 + vector retrieval, reciprocal rank fusion, reranking, and bounded context selection.
- Implemented structured validation, independent AI review, and targeted repair before verified exams are saved; routed generation through OpenAI, Gemini, and DeepSeek providers.
- Developed a FastAPI/PostgreSQL backend and React/TypeScript frontend, with AI usage tracking and Docker Compose services.

12/2025 – 02/2026 **GAN Satellite Segmentation — Full-Stack Web App (Owner)**
https://github.com/kamusarj/GAN-segmentation

- Built a seven-class LoveDA land-cover segmentation pipeline with image preprocessing, augmentation, model training, and evaluation.
- Combined a DeepLabV3+ / ResNet50 generator with PatchGAN and adversarial plus cross-entropy losses; achieved 0.5297 mean IoU and 70.7% pixel accuracy on validation data.
- Delivered a FastAPI and PostgreSQL inference service with JWT authentication, and a React interface for mask overlays, per-class statistics, map selection, and history.
- Containerized frontend, backend, and database with Docker Compose; provided reproducible training and evaluation scripts.

Research & Awards

06/2026 **Optimal Charging Station Recommendation for Electric Vehicles in Vietnam**
TNU Journal of Science and Technology, 231(07), 336–346. doi:10.34238/tnu-jst.15785

- Co-authored a published multi-criteria recommendation system ranking feasible charging stations by travel distance, total time, and estimated cost using VietMap routes, port compatibility, and vehicle state of charge.
- Won **First Prize** in the university-level Student Scientific Research Competition at Hanoi University of Industry.

Skills

Programming	Python, C++, TypeScript, SQL
AI & ML	PyTorch, TensorFlow/Keras, Scikit-learn, VLA, Transformers, GAN, DeepLabV3+, FAISS, RAG, model fine-tuning and evaluation
Engineering	FastAPI, React, PostgreSQL, Docker Compose, GGML/GGUF, CUDA, Git, Linux
Languages	Vietnamese; English (basic reading and communication)
